The versatile BI Solution

Discover Click&DECiDE for IBM iSeries and AS/400

Click&DECiDE's web based Ad-Hoc Query and Reporting Tool for IBM iSeries and AS/400 enables you to perform:

Reporting: Report on enterprise-wide data. Create, manage, and deliver server-based reports with interactive views that provide valuable insights into where business is heading. All levels of users can produce and access reports.

Query & Analysis: Provide a consolidated view across all business dimensions as the foundation for all relational, multidimensional, and predictive analysis, enabling deep insight into the key drivers impacting businesses today.

Cubes: Analyze summary data organized along business dimensions.

Visualization: Present data in charts, graphs and maps within multiple BI applications.

Web-based Reporting: Integrate the full breadth of *Click*&DECiDE analytics and make results available to all.

Key Strengths

User-Friendly: a natural day-to-day end-user tool. It optimizes the use of your data by allowing end-users to perform flexible and complex queries. No database or SQL knowledge is required.

Pervasive: delivers intuitive, role-based intelligence for everyone in an organization - from front line employees to senior management -that enables better decisions, actions, and business processes.

Hot-Pluggable: use your existing data sources and systems! *Click*&DECiDE offers optimized native access to relational databases: AS400 (iSeries), DB2-UDB, CAE-DB2/2, Oracle, Microsoft SQL Server, Progress, Sybase. This removes the need to install and configure ODBC pilots for the above list. For other relational databases, all ODBC pilots are supported by default.

Scalable: Click&Decide is highly scalable and supports a wide range of business system environments to meet your enterprise needs and build a holistic view of your business.

Key Benefits

Click&DECiDE is a component-based tool where queries can be used in combination with different presentation layers for example Reports, Dashboards and OLAP Cubes.

Ad Hoc queries: with the result shown in many optional formats such as HTML, PDF, Excel etc…

Multi-dimensional data views via Cubes: *Click*&DECiDE generates real-time cubes - to enable you to interactively examine your results in various dimensions of data. Cubes can be easily accessed from the *Click*&DECiDE Web Portal. To view Cubes you need to use Internet Explorer with Microsoft Office 2003 Web Components.

Dynamic and static reports in many formats (HTML, PDF, Excel).

Scheduled and customized production of report books with distribution (via e-mail) to users in the whole organization.

Multi-user Web Portal functionality managing BI-applications for users. Powerful management of variables linked to user profiles to enable the same application to distribute personalized information to many different users at the same time.

Top 5 Functions tailored to IBM iSeries

1. Converting existing IBM iSeries – AS/400 queries. Select an AS/400 query and directly convert it to a graphic *Click*&DECiDE query that can be completed with dialogue boxes to input variables and display a new presentation layer. Converted AS/400 queries can then be used by the user via the web site.

2. A sequence of queries can now be run via *Click*&DECiDE script language (VBScript) in order to prepare data to a data warehouse or to a BI-application.

3. A new "Run Command" function enables the user to run iSeries Commands using *Click*&DECiDE's script language launched via Windows Scheduler.

4. D7NOTIFY is a new function which converts an event on iSeries to an action on the PC-side. For example, a job which is ready on AS/400 can launch a report's production and distribution to the users in the organization. It can also be used for an updated transaction on the AS/400 side to be sent directly via IP and HTTP to a server in order to launch a program or print a document over the Internet that contains the data of the transaction.

5. To replace Query 400, *Click*&DECiDE Queries can now be run as batch jobs (Run in Batch) and create a table of results on the (Store on Server) IBM iSeries server.

Click&DECiDE is a versatile business intelligence solution thanks to its component based architecture where queries can be used in a combination with different presentation layers, such as reports, drilldown reports, ad-hoc queries, cube-applications, EBIS-presentations and data transfer routines.
